Woodsafe PRO flameretardant wood looks and feels like ordinary wood but not like you are betting on. Unlike ordinary wood, wood panels and plywood impregnated with Woodsafe PRO technology have the highest fire-technical performance relevant to wood. Fire protection properties are found all around the surface of the wood, deep into the cell structure and insensitive to natural movements and normal wear and tear. The unique properties of fire do not need to be maintained or renewed in normal use.

Choosing a system

is more than just a fireclass.

Choosing a system for flameretardant surface layers is more than just a fire class. Factors such as how should the product be mounted in relation to documented properties, underlying substrate, 4-sided exposure and last but not least, how to compare system?

Woodsafe PRO is always 4 pages flameretardanted through impregnation, this should be compared with fire painting which been painted on all sides or as a spar panel on 3 sides. How to ensure such a quality, think about it. For those who manage the building, what is the economic life of different systems, think about it.

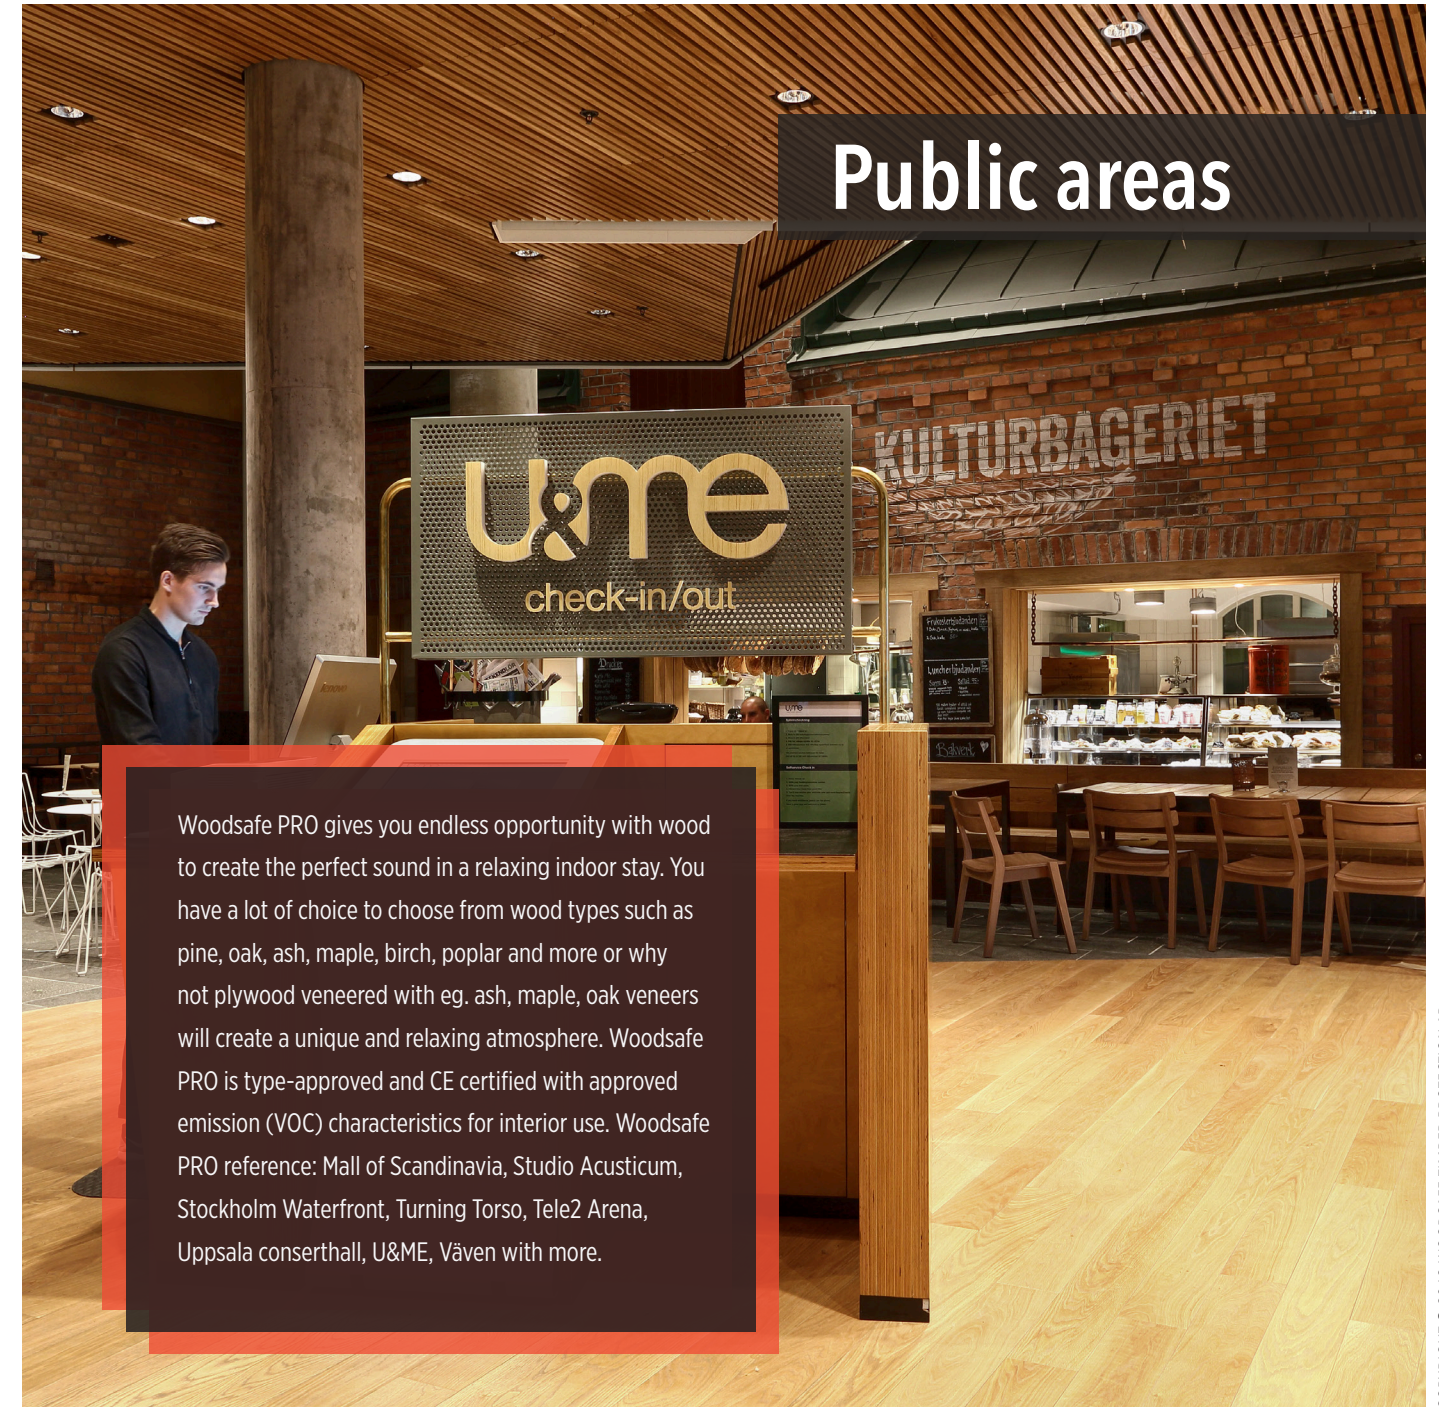

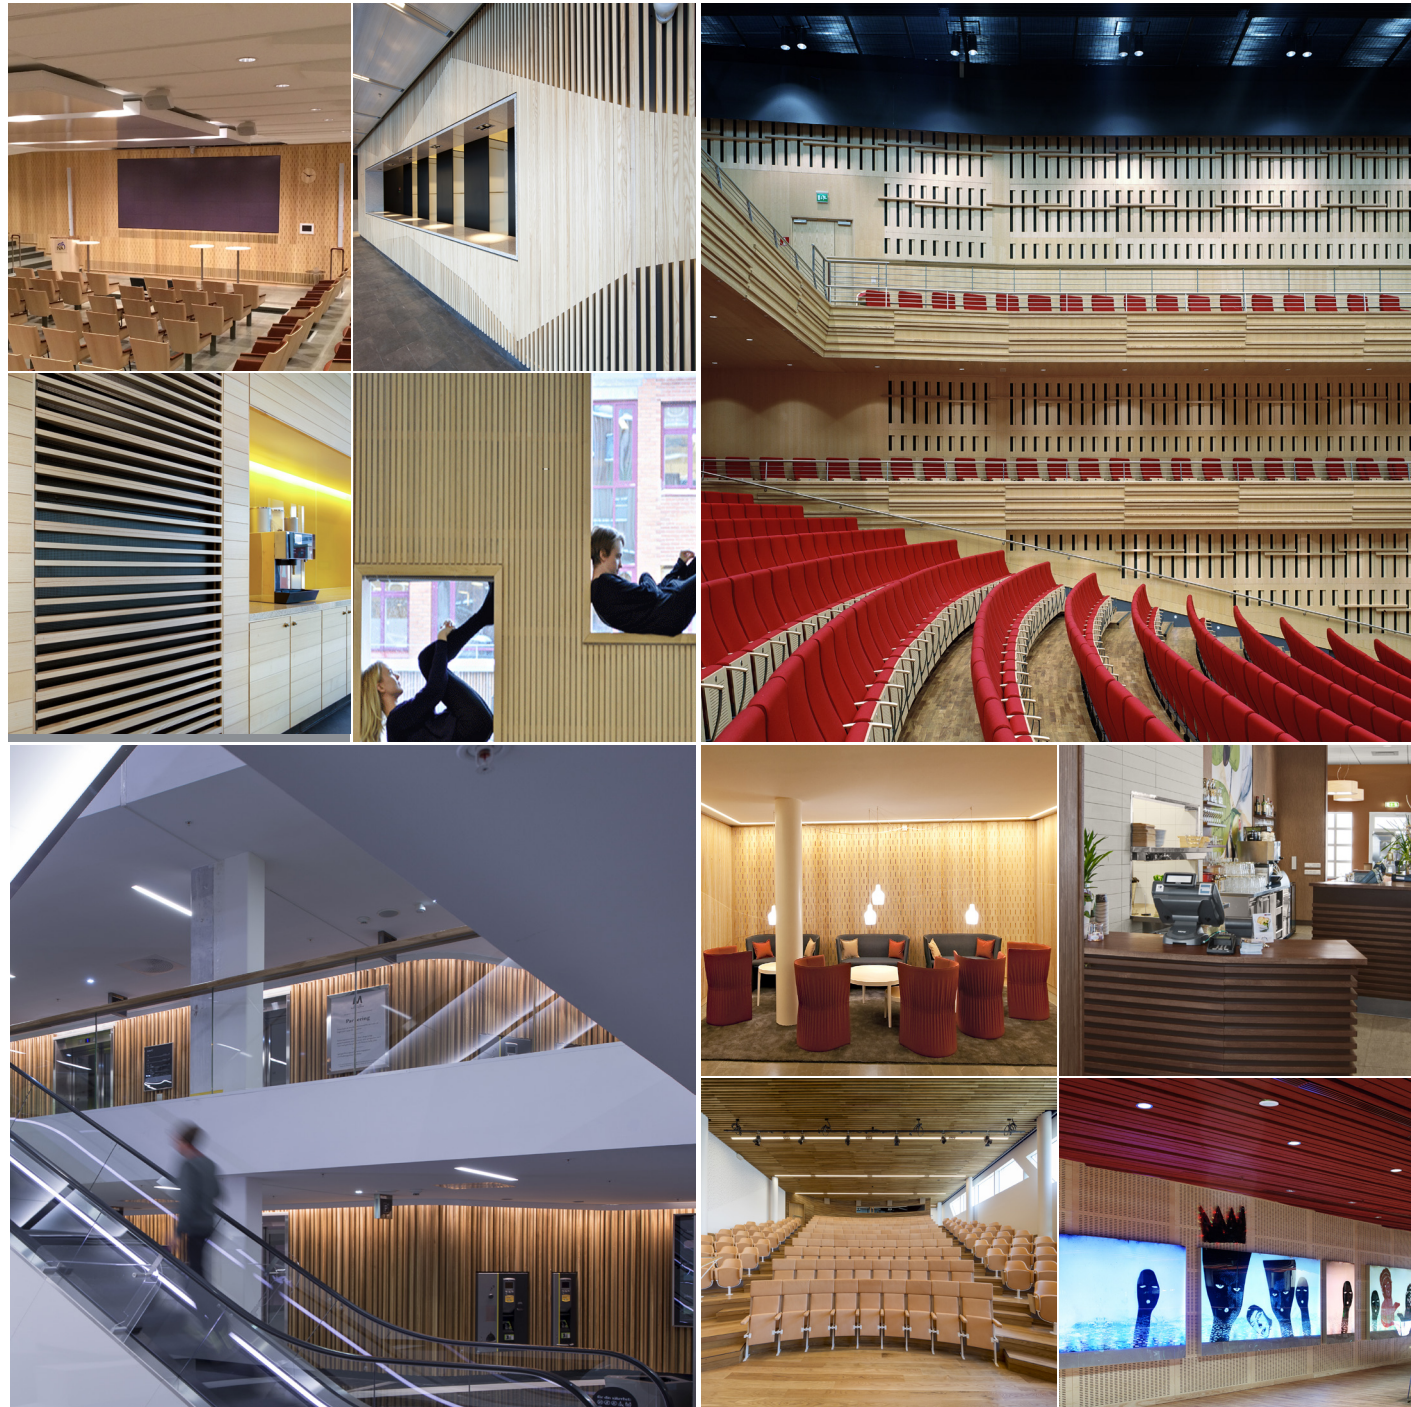

There are many issues to consider before choosing a system. If the design can be documented, the product is CE marked, - unless it is approved according to ETAG 028.

Want to be sure to get the right documentation and expert answers to your questions.
